EvoCrete® ST - Product and Process Advantages:

Environmentally friendly production of drilling pads and access roads from the soil on site

Significant construction time reduction for the production of the drilling pads or access roads, because up to 5,000 m² of high load-bearing base layer can be produced per day

EvoCrete® ST base courses have a more than 6 times higher load-bearing capacity than ballast base courses

EvoCrete® ST base courses do not lose their load-bearing capacity during rain and frost events, as EvoCrete ST base courses are impermeable to water and temperature stable

EvoCrete® ST base layers protect the natural resources of groundwater and soil from environmentally hazardous contamination, because EvoCrete® ST base courses are impermeable to liquids

Using EvoCrete® ST to produce the base course leads to a reduction in environmentally harmful influences such as carbon dioxide emissions and the consumption of natural resources

EvoCrete® ST applications lead to a significant reduction in construction times, construction costs and maintenance efforts

EvoCrete® ST - the economical, environmentally friendly standard leads to the following in the broad spectrum of business:

- **shortened construction time;**
- **cost reduction;**
- **performance increase;**
- **long service life;**
- **environmentally friendly;**
- **and low maintenance.**
